<p style="text-align:center">What Tags I Used and Why</p>

1. </p>
   <form style="display: inline;" action=" "

   This is an image tag that I used to include the main image on my website, of East Campus Village (where I lived as a freshman). I copied the image address and pasted it into the quotations so that it would appear where it did.

2. <button> </button>

   This tag is similar to the link tag, except it's a button instead. I used this right below my Image tag to give the user an opportunity to go to another website that had more UGA campus pictures.

3. <p> </p>

   The paragraph tag was necessary to include the background information on my website. Pretty much everything had to be confined into these tags, so I could not have made the website without it.

4. <style type="text/css">
   </style>

   Within these style tags was where I included all the details I wanted for the font, background color, position of the tables, etc.

5. P {font-family:"Times New Roman"}
   body {text-align:center;background-color:red}

These tags were within the style tags, and I used the font-family tag to establish the font I wanted for the entire website. I also included above, the tag I used to change the background color to red (UGA's theme color).

6. table#t01 {background-color:white}
   ol#l01 {text-align: center; list-style-position:inside}
   table.center {margin-left:auto;margin-right:auto;}

   These are the tags I used to edit the details of my table comparing some of the housing options. I made the background color of the table white so the user could see it, and obviously centered it to where it flowed with the rest of the site.

7. <th> </th>

   These tags were used to insert the different sections of the table, such as the name of the building, the location, the pros and the cons.

8.

These tags were used to bold one of the sentences on my website. I put them after the <p> tag when I wanted to bold something, so it would stand out to the reader.

9. <ol id="l01">&nbsp;

These are the types of tags I used to make the numbered list of other housing options. For every number, I used the "<liu> " and then to start and end it I used the <ol id=101"> and "
". I chose a numbered list to show how many options there were available to people.

10. <a href= "…"

I used this tag (with the link in between the quotation marks) to include the link for more information at the end of my website. I chose a link rather than a button here because I already used a button at the beginning, so I wanted to use a different feature/tag. Clicking on the words "This Wiki page" will take the user to an entire page with information on student housing.
